

600V / 2A  
PSR Single-Stage APFC AC-DC LED Driver

---

## DESCRIPTION

M1872 is a single-stage primary side control AC- DC LED driver with active power factor correction, specially designed for universal input offline Flyback or buck-boost constant current LED lighting. The controller with on-chip PFC circuit achieves high power factor and low THD. Operating in critical conduction mode, the power MOSFET switching loss is reduced and the inductor is fully utilized.

The M1872 offers rich protection functions to improve the system reliability, including LED open circuit protection, LED short circuit protection, VCC under voltage protection, CS resistor open circuit protection and cycle by cycle current limit. All the protection functions are auto-recovery. The system reliability is further improved by the thermal regulation function. The output current is reduced when the driver is over temperature.

## FEATURE

- Active PFC for High Power Factor and Low THD
- Primary side control eliminates the opto-coupler
- MOSFET Internal 600V, 2A Power MOSFET
- High Resistance Feedback Resistor for Improved Efficiency
- Ultra Low (30uA) Start Up Current
- $\pm 3\%$  LED Output Current Accuracy
- Excellent Line and Load Regulation
- Critical Conduction Mode Operation
- Ultra Low Start Up Current
- LED Short/Open Protection
- Current Sensing Resistor Open Protection
- Cycle by Cycle Current Limit
- VCC Under Voltage Protection
- Auto Fault Recovery
- Thermal Regulation Function
- SOP-8 Package

## APPLICATIONS

- LED Bulb
- LED String

**PIN ASSIGNMENT**

**PIN DEFINITION**

Pin No.	Pin name	I/O	Description
1	COMP	I	Loop Compensation Node. This pin connects a capacitor to GND for stabilization of the control loop, achieving accurate
2	VCC	—	Power Supply Pin.
3	ZCD	I	Inductor current zero-crossing detection pin, This pin detects the transformer demagnetization signal and the output voltage.
4	CS	I	Current Sense Pin. Connect a resistor to GND
5,6	DRAIN	O	Internal HV Power MOSFET Drain
7,8	GND	—	Ground

## FUNCTION DESCRIPTION

M1872 is a primary side controller for AC- DC LED driver. The LED current can be accurately regulated through sensing the primary side information to realize real current control.M1872 integrates power factor correction function to eliminate pollution to the AC line and works in BCM (Critical Conduction Mode).

### 1. Start Up

After system powered up, the VCC pin capacitor is charged up by the startup resistor. When the VCC pin voltage reaches the turn on threshold, the internal circuits start working. The COMP pin voltage is pulled up to 1.5V quickly, and then the M1872 starts switching. The system works at 10 KHz frequency at the beginning, the COMP voltage rises up gradually, and the inductor peak current also rises up. The LED current hence achieves a soft start without overshoot. After the output voltage is built up, the VCC power is supplied by the output voltage through a diode.

### 2. Constant Current Controls

The M1872 adopts proprietary primary-side current sensing scheme. It can precisely control the LED current without secondary side sense and feedback circuit. The current in LED can be calculated by the equation:

$$I_{out} = \frac{V_{ref}}{2 \times R_{cs}} \times \frac{N_p}{N_s}$$

Where,

$V_{ref}$  : Internal reference voltage

$N_p$  : Primary winding turns of transformer

$N_s$  : Secondary winding turns of transformer

$R_{cs}$  : The current sensing resistor value

### 3. Feedback Network

The M1872 senses the output current zero crossing information through the feedback network, the ZCD falling threshold voltage is set to 0.1V with 0.08V hysteresis. The ZCD pin is also used to detect output OVP, the threshold voltage is 1.6V. The ratio of ZCD upper resistor to lower resistor can be set as:

$$\frac{R_{zcdl}}{R_{zcdl} + R_{zcdh}} = \frac{1.6V}{V_{ovp\_zcd}} \times \frac{N_s}{N_A}$$

Where,

$R_{zcdl}$  : The lower resistor of the feedback network

$R_{zcdh}$  : The upper resistor of the feedback network

$V_{OVP\_ZCD}$  : Output over voltage setting point

$N_s$  : Secondary winding turns of transformer

$N_A$  : Auxiliary winding turns of transformer

The ZCD upper resistor can be set to around 300KΩ to improve the system efficiency. It is also used for fine tuning the LED current line compensation.

#### 4. Thermal Regulations

The M1872 integrates thermal regulation function. When the system is over temperature, the output current is gradually reduced; the output power and thermal dissipation are also reduced. The system temperature is regulated and the system reliability is improved. The thermal regulation temperature is set to 150°C internally.

#### 5. Protection Functions

The M1872 offers rich protection functions to improve the system reliability. When the LED is open circuit, the output voltage will gradually rise up. The output voltage is sensed by the ZCD pin when power MOSFET is turned off. When ZCD voltage reaches the OVP threshold, it will trigger fault logic and the system stops switching. When the LED is shorted circuit, the system will work under 10 KHz switching frequency. Meanwhile, the output voltage is low and the VCC pin cannot be charged up by the output voltage, so the VCC pin voltage will gradually decrease and finally reaches the UVLO threshold. After the system enters into fault condition, the VCC voltage will decrease until it reaches UVLO threshold. Then the system will re-start again. If the fault condition is removed, the system will resume normal operation. When the output is short circuit or the inductor is saturated, the CS peak voltage will be relatively high. When CS voltage reaches the internal limitation (1V), the power MOSFET will be turned off instantaneously. This cycle by cycle current limitation can help protecting the power MOSFET, the inductor and the output diode.

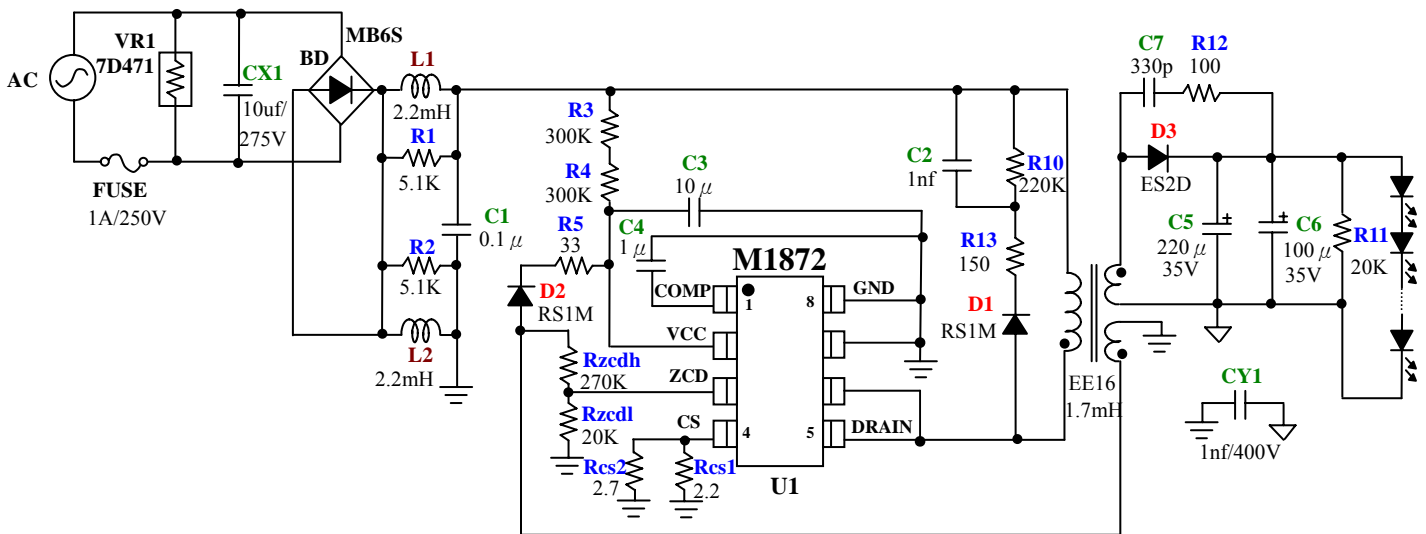

### TYPICAL APPLICATION

#### 7W LED Bulb

Input Voltage : 90Vac ~ 265Vac ; 47Hz ~ 63Hz

Output Voltage : 16V ~ 23V

Output Current : 320mA
